**Abstract.** In this paper, we introduce a new classes of sets called  $\tilde{E}$ -closed sets and  $\tilde{E}_\alpha$ -closed sets in topological spaces and we study some of its basic properties. This class lies between the class of closed sets and the class of g-closed sets.

**Keywords:** Closed set;  $\tilde{E}$ -closed set;  $\tilde{E}_\alpha$ -closed set.

## 1. INTRODUCTION

In 1963, Levine [1-2] was introduced by the notions of semi-open sets and g-closed sets are investigated its fundamental properties also. Since the advent of the notion of semi-open sets, many mathematicians worked on such sets and also introduced some other notions such as [3-15].

## 2. PRELIMINARIES

We recall the following definitions which are useful in the sequel.

**Definition 2.1.** A subset  $A$  of a space  $(X, \tau)$  is called

- (i) semi-open set [8] if  $A \subseteq \text{cl}(\text{int}(A))$ ;
- (ii) preopen set [11] if  $A \subseteq \text{int}(\text{cl}(A))$ ;
- (iii)  $\alpha$ -open set [12] if  $A \subseteq \text{int}(\text{cl}(\text{int}(A)))$ ;
- (iv)  $\beta$ -open set [1] (= semi-preopen set [2]) if  $A \subseteq \text{cl}(\text{int}(\text{cl}(A)))$ ;
- (v) regular open set [14] if  $A = \text{int}(\text{cl}(A))$ .

The complements of the above mentioned open sets are called their respective closed sets.

**Definition 2.2.** A subset  $A$  of a space  $(X, \tau)$  is called

- (i) a generalized closed (briefly g-closed) set [9] if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ . The complement of g-closed set is called g-open set;
- (ii) a semi-generalized closed (briefly sg-closed) set [4] if  $\text{scl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is semi-open in  $(X, \tau)$ . The complement of sg-closed set is called sg-open set;

- (iii) a generalized semi-closed (briefly gs-closed) set [3] if  $\text{scl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ . The complement of gs-closed set is called gs-open set;
- (iv) an  $\alpha$ -generalized closed (briefly  $\alpha$ g-closed) set [10] if  $\alpha \text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ . The complement of  $\alpha$ g-closed set is called  $\alpha$ g-open set;
- (v) a generalized semi-preclosed (briefly gsp-closed) set [6] if  $\text{spcl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ . The complement of gsp-closed set is called gsp-open set;
- (vi) a  $\hat{g}$ -closed set [7] if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is sg-open in  $(X, \tau)$ . The complement of  $\hat{g}$ -closed set is called  $\hat{g}$ -open set.
- (vii) a  $\hat{g}$ -closed set [15] (=  $\omega$ -closed set [13]) if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is semi-open. The complement of  $\hat{g}$ -closed set is called  $\hat{g}$ -open.

**Definition 2.3.** [5] Let  $(X, \tau)$  be a topological space and  $A \subseteq X$ . We define the sg-closure of  $A$  (briefly,  $\text{sg-cl}(A)$ ) to be the intersection of all sg-closed sets containing  $A$ .

### 3. ON $\tilde{E}$ -CLOSED SETS

We introduce the following definitions.

**Definition 3.1.**

- (i) A subset  $A$  of a space  $(X, \tau)$  is called a  $A$ -closed set if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\hat{g}$ -open in  $(X, \tau)$ .

The complement of  $A$ -closed set is called  $A$ -open set.

- (ii) A subset  $A$  of a space  $(X, \tau)$  is called a  $B$ -closed set if  $\text{scl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $A$ -open in  $(X, \tau)$ .

The complement of  $B$ -closed set is called  $B$ -open set.

The collection of all  $A$ -closed (resp.  $B$ -closed) sets in  $X$  is denoted by  $AC(X)$  (resp.  $BC(X)$ ).

**Definition 3.2.** A subset  $A$  of a space  $(X, \tau)$  is called a  $\tilde{E}$ -closed set if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $B$ -open in  $(X, \tau)$ .

The complement of  $\tilde{E}$ -closed set is called  $\tilde{E}$ -open set.

The collection of all  $\tilde{E}$  closed set in  $X$  is denoted by  $\tilde{E}C(X)$ .

**Remark 3.3.**

- (i) Each closed set is  $A$ -closed but not conversely.
- (ii) Each closed set is  $B$ -closed but not conversely.
- (iii) Each semi-open set is  $B$ -open but not conversely.

**Example 3.4.** Let  $X = \{a, b, c\}$  with  $\tau = \{\phi, \{a\}, X\}$ . Then

$$AC(X) = \{\phi, \{b\}, \{c\}, \{a, b\}, \{a, c\}, \{b, c\}, X\};$$

$$BC(X) = \{\phi, \{b\}, \{c\}, \{b, c\}, X\}$$

and

$$SO(X) = \{\phi, \{a\}, \{a, b\}, \{a, c\}, X\}.$$

Then:

- (i)  $\{b\}$  is A-closed but not closed.
- (ii)  $\{b\}$  is B-closed but not closed.

**Example 3.5.** Let  $X = \{a, b, c\}$  with  $\tau = \{\phi, \{a, b\}, X\}$ . Then

$$BO(X) = \{\phi, \{a\}, \{b\}, \{a, b\}, X\}$$

and

$$SO(X) = \{\phi, \{a, b\}, X\}.$$

We have  $A = \{a\}$  is B-open but not semi-open.

**Proposition 3.6.** Each closed set is  $\tilde{E}$ -closed in  $X$ .

*Proof:* If  $A$  is any closed set in  $X$  and  $G$  is any B-open set containing  $A$ , then  $G \supseteq A = \text{cl}(A)$ . Hence  $A$  is  $\tilde{E}$ -closed.

The converse of Proposition 3.6 need not be true as seen from the following example.

**Example 3.7.** Let  $X$  and  $\tau$  be as in Example 1.3.5. Then

$$\tilde{E}C(X) = \{\phi, \{c\}, \{a, c\}, \{b, c\}, X\}.$$

We have  $A = \{a, c\}$  is  $\tilde{E}$ -closed set but not closed.

**Definition 3.8.** A subset  $A$  of a space  $(X, \tau)$  is called a  $\tilde{E}_\alpha$ -closed set if  $\alpha \text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is B-open in  $(X, \tau)$ .

The complement of  $\tilde{E}_\alpha$ -closed set is called  $\tilde{E}_\alpha$ -open set.

The collection of all  $\tilde{E}_\alpha$ -closed (resp.  $\tilde{E}_\alpha$ -open) sets in  $X$  is denoted by  $\tilde{E}_\alpha C(X)$  (resp.  $\tilde{E}_\alpha O(X)$ ).

**Proposition 3.9.** Each  $\tilde{E}$ -closed set is  $\tilde{E}_\alpha$ -closed in  $X$ .

*Proof:* If  $A$  is a  $\tilde{E}$ -closed set in  $X$  and  $G$  is any B-open set containing  $A$ , then  $G \supseteq \text{cl}(A) \supseteq \alpha \text{cl}(A)$ . Hence  $A$  is  $\tilde{E}_\alpha$ -closed.

The converse of Proposition 3.9 need not be true as seen from the following example.

**Example 3.10.** Let  $X = \{a, b, c\}$  with  $\tau = \{\phi, \{b\}, X\}$ . Then

$$\tilde{E}C(X) = \{\phi, \{a, c\}, X\}$$

and

$$\tilde{E}_\alpha C(X) = \{\phi, \{a\}, \{c\}, \{a, c\}, X\}.$$

We have  $A = \{a\}$  is  $\tilde{E}_\alpha$ -closed set but not  $\tilde{E}$ -closed.

**Proposition 3.11.** Each  $\tilde{E}$ -closed set is sg-closed in  $X$ .

*Proof:* If  $A$  is a  $\tilde{E}$ -closed set in  $X$  and  $G$  is any semi-open set containing  $A$ , since every semi-open set is  $B$ -open and  $A$  is  $\tilde{E}$ -closed, we have  $G \supseteq \text{cl}(A) \supseteq \text{scl}(A)$ . Hence  $A$  is  $sg$ -closed.

The converse of Proposition 3.11 need not be true as seen from the following example.

**Example 3.12.** Let  $X$  and  $\tau$  be as in Example 3.4. Then

$$\tilde{E}C(X) = \{\phi, \{b, c\}, X\}$$

and

$$SGC(X) = \{\phi, \{b\}, \{c\}, \{b, c\}, X\}.$$

We have  $A = \{b\}$  is  $sg$ -closed set but not  $\tilde{E}$ -closed.

**Proposition 3.13.** Each  $\tilde{E}$ -closed set is  $g$ -closed in  $X$ .

*Proof:* If  $A$  is a  $\tilde{E}$ -closed set in  $(X, \tau)$  and  $G$  is any open set containing  $A$ , since every open set is  $B$ -open, we have  $G \supseteq \text{cl}(A)$ . Hence  $A$  is  $g$ -closed.

The converse of Proposition 3.13 need not be true as seen from the following example.

**Example 3.14.** Let  $X$  and  $\tau$  be as in Example 3.4. Then

$$GC(X) = \{\phi, \{b\}, \{c\}, \{a, b\}, \{a, c\}, \{b, c\}, X\}$$

and

$$\tilde{E}C(X) = \{\phi, \{b, c\}, X\}.$$

We have  $A = \{a, b\}$  is  $g$ -closed set but not  $\tilde{E}$ -closed.

**Proposition 3.15.** Each  $\tilde{E}$ -closed set is  $\alpha g$ -closed in  $X$ .

*Proof:* If  $A$  is a  $\tilde{E}$ -closed set in  $X$  and  $G$  is any open set containing  $A$ , since every open set is  $B$ -open, we have  $G \supseteq \text{cl}(A) \supseteq \alpha \text{cl}(A)$ . Hence  $A$  is  $\alpha g$ -closed.

The converse of Proposition 3.15 need not be true as seen from the following example.

**Example 3.16.** Let  $X$  and  $\tau$  be as in Example 3.4. Then

$$\tilde{E}C(X) = \{\phi, \{b, c\}, X\}$$

and

$$\alpha GC(X) = \{\phi, \{b\}, \{c\}, \{a, b\}, \{a, c\}, \{b, c\}, X\}.$$

We have  $A = \{a, c\}$  is  $\alpha g$ -closed set but not  $\tilde{E}$ -closed.

**Proposition 3.17.** Each  $\tilde{E}$ -closed set is  $gs$ -closed in  $X$ .

*Proof:* If  $A$  is a  $\tilde{E}$ -closed set in  $X$  and  $G$  is any open set containing  $A$ , since every open set is  $B$ -open, we have  $G \supseteq \text{cl}(A) \supseteq \text{scl}(A)$ . Hence  $A$  is  $gs$ -closed.

The converse of Proposition 3.17 need not be true as seen from the following example.

**Example 3.18.** Let  $X = \{a, b, c\}$  with  $\tau = \{\phi, \{b\}, \{a, b\}, X\}$ . Then

$$\tilde{E}C(X) = \{\phi, \{c\}, \{a, c\}, X\}$$

and

$$GSC(X) = \{\emptyset, \{a\}, \{c\}, \{a, c\}, \{b, c\}, X\}.$$

We have  $A = \{a\}$  is gs-closed set but not  $\tilde{E}$ -closed.

**Proposition 3.19.** Each  $\tilde{E}$ -closed set is gsp-closed in  $X$ .

*Proof:* If  $A$  is a  $\tilde{E}$ -closed set in  $X$  and  $G$  is any open set containing  $A$ , every open set is  $B$ -open, we have  $G \supseteq cl(A) \supseteq spcl(A)$ . Hence  $A$  is gsp-closed.

The converse of Proposition 3.19 need not be true as seen from the following example.

**Example 3.20.** Let  $X$  and  $\tau$  be as in Example 3.10. Then

$$\tilde{E}C(X) = \{\emptyset, \{a, c\}, X\}$$

and

$$GSPC(X) = \{\emptyset, \{a\}, \{c\}, \{a, b\}, \{a, c\}, \{b, c\}, X\}.$$

We have  $A = \{a\}$  is gsp-closed set but not  $\tilde{E}$ -closed.

**Remark 3.21.** The following examples show that  $\tilde{E}$ -closed sets are independent of  $\alpha$ -closed sets and semi-closed sets.

**Example 3.22.** Let  $X$  and  $\tau$  be as in Example 3.5. Then

$$\tilde{E}C(X) = \{\emptyset, \{c\}, \{a, c\}, \{b, c\}, X\}$$

and

$$\alpha C(X) = SC(X) = \{\emptyset, \{c\}, X\}.$$

We have  $A = \{a, c\}$  is  $\tilde{E}$ -closed set but it is neither  $\alpha$ -closed nor semi-closed.

**Example 3.23.** Let  $X$  and  $\tau$  be as in Example 1.3.4. Then

$$\tilde{E}C(X) = \{\emptyset, \{b, c\}, X\}$$

and

$$\alpha C(X) = SC(X) = \{\emptyset, \{b\}, \{c\}, \{b, c\}, X\}.$$

We have  $A = \{b\}$  is both  $\alpha$ -closed set and semi-closed set but not  $\tilde{E}$ -closed.

#### 4. MORE PROPERTIES

In this section, we discuss some basic properties of  $\tilde{E}$ -closed sets.

**Definition 4.1.** The intersection of all  $B$ -open subsets in  $(X, \tau)$  containing  $A$  is called the  $B$ -kernel of  $A$  and denoted by  $B\text{-ker}(A)$ .

**Lemma 4.2.** A subset  $A$  of  $(X, \tau)$  is  $\tilde{E}$ -closed if and only if  $cl(A) \subseteq B\text{-ker}(A)$ .

*Proof:* Suppose that  $A$  is  $\tilde{E}$ -closed. Then  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $B$ -open. Let  $x \in \text{cl}(A)$ . If  $x \notin B\text{-ker}(A)$ , then there is a  $B$ -open set  $U$  containing  $A$  such that  $x \notin U$ . Since  $U$  is a  $B$ -open set containing  $A$ , we have  $x \in \text{cl}(A)$  and this is a contradiction.

Conversely, let  $\text{cl}(A) \subseteq B\text{-ker}(A)$ . If  $U$  is any  $B$ -open set containing  $A$ , then  $\text{cl}(A) \subseteq B\text{-ker}(A) \subseteq U$ . Therefore,  $A$  is  $\tilde{E}$ -closed.

**Proposition 4.3.** If  $A$  and  $B$  are  $\tilde{E}$ -closed sets in  $(X, \tau)$  then  $A \cup B$  is  $\approx$ g-closed in  $(X, \tau)$ .

*Proof:* If  $A \cup B \subseteq G$  and  $G$  is  $B$ -open, then  $A \subseteq G$  and  $B \subseteq G$ . Since  $A$  and  $B$  are  $\tilde{E}$ -closed,  $G \supseteq \text{cl}(A)$  and  $G \supseteq \text{cl}(B)$  and hence  $G \supseteq \text{cl}(A) \cup \text{cl}(B) = \text{cl}(A \cup B)$ . Thus  $A \cup B$  is  $\tilde{E}$ -closed set in  $(X, \tau)$ .

**Proposition 4.4.** If a set  $A$  is  $\tilde{E}$ -closed in  $(X, \tau)$  then  $\text{cl}(A) - A$  contains no nonempty  $B$ -closed set in  $(X, \tau)$ .

*Proof:* Suppose that  $A$  is  $\tilde{E}$ -closed. Let  $F$  be a  $B$ -closed subset of  $\text{cl}(A) - A$ . Then  $A \subseteq F^c$ . Since  $A$  is  $\tilde{E}$ -closed,  $\text{cl}(A) \subseteq F^c$ . Consequently,  $F \subseteq (\text{cl}(A))^c$ . We already have  $F \subseteq \text{cl}(A)$ . Thus  $F \subseteq \text{cl}(A) \cap (\text{cl}(A))^c$  and  $F$  is empty.

The converse of Proposition 4.4 need not be true as seen from the following example.

**Example 4.5.** Let  $X = \{a, b, c, d\}$  with  $\tau = \{\phi, \{a, d\}, X\}$ . Then

$$\approx \text{GC}(X) = \{\phi, \{b, c\}, \{a, b, c\}, \{b, c, d\}, X\}$$

and

$$\text{BC}(X) = \{\phi, \{a\}, \{d\}, \{a, b\}, \{a, c\}, \{a, d\}, \{b, c\}, \{a, b, c\}, \{a, b, d\}, \{a, c, d\}, X\}.$$

If  $A = \{b\}$  then  $\text{cl}(A) - A = \{c\}$  does not contain any nonempty  $B$ -closed set. But  $A$  is not  $\tilde{E}$ -closed.

**Theorem 4.6.** If a set  $A$  is  $\tilde{E}$ -closed, then  $\text{cl}(A) - A$  contains no nonempty closed set.

*Proof:* Suppose that  $A$  is  $\tilde{E}$ -closed. Let  $S$  be a closed subset of  $\text{cl}(A) - A$ . Then  $A \subseteq S^c$ . Since  $A$  is  $\tilde{E}$ -closed, we have  $\text{cl}(A) \subseteq S^c$ . Consequently,  $S \subseteq (\text{cl}(A))^c$ . Hence,  $S \subseteq \text{cl}(A) \cap (\text{cl}(A))^c = \phi$ . Therefore  $S$  is empty.

**Proposition 4.7.** If  $A$  is  $\tilde{E}$ -closed set in  $(X, \tau)$  and  $A \subseteq B \subseteq \text{cl}(A)$ , then  $B$  is  $\tilde{E}$ -closed set in  $(X, \tau)$ .

*Proof:* Let  $B \subseteq U$  where  $U$  is  $B$ -open set in  $(X, \tau)$ . Since  $A \subseteq B$ ,  $A \subseteq U$ . Since  $A$  is  $\tilde{E}$ -closed set,  $\text{cl}(A) \subseteq U$ . Since  $B \subseteq \text{cl}(A)$ ,  $\text{cl}(B) \subseteq \text{cl}(A) \subseteq U$ . Therefore  $B$  is  $\tilde{E}$ -closed set in  $(X, \tau)$ .

**Proposition 4.8.** Let  $A \subseteq Y \subseteq X$  and suppose that  $A$  is  $\tilde{E}$ -closed in  $(X, \tau)$ . Then  $A$  is  $\tilde{E}$ -closed relative to  $Y$ .

*Proof:* Let  $A \subseteq Y \cap G$ , where  $G$  is  $B$ -open in  $(X, \tau)$ . Then  $A \subseteq G$  and hence  $\text{cl}(A) \subseteq G$ . This implies that  $Y \cap \text{cl}(A) \subseteq Y \cap G$ . Thus  $A$  is  $\tilde{E}$ -closed relative to  $Y$ .

**Proposition 4.9.** If  $A$  is an  $B$ -open and  $\tilde{E}$ -closed in  $(X, \tau)$ , then  $A$  is closed in  $(X, \tau)$ .

*Proof:* Since  $A$  is  $B$ -open and  $\tilde{E}$ -closed,  $\text{cl}(A) \subseteq A$  and hence  $A$  is closed in  $(X, \tau)$ .

**Theorem 4.10.** Let  $A$  be a locally closed set of  $(X, \tau)$ . Then  $A$  is closed if and only if  $A$  is  $\tilde{E}$ -closed.

*Proof:* It is fact that every closed set is  $\tilde{E}$ -closed.

Conversely, by Proposition 3.3 of Bourbaki [9],  $A \cup (X - \text{cl}(A))$  is open in  $(X, \tau)$ , since  $A$  is locally closed. Now  $A \cup (X - \text{cl}(A))$  is  $B$ -open set of  $(X, \tau)$  such that  $A \subseteq A \cup (X - \text{cl}(A))$ . Since  $A$  is  $\tilde{E}$ -closed, then  $\text{cl}(A) \subseteq A \cup (X - \text{cl}(A))$ . Thus, we have  $\text{cl}(A) \subseteq A$  and hence  $A$  is a closed.

**Proposition 4.11.** For each  $x \in X$ , either  $\{x\}$  is  $B$ -closed or  $\{x\}^c$  is  $\tilde{E}$ -closed in  $(X, \tau)$ .

*Proof:* Suppose that  $\{x\}$  is not  $B$ -closed in  $(X, \tau)$ . Then  $\{x\}^c$  is not  $B$ -open and the only  $B$ -open set containing  $\{x\}^c$  is the space  $X$  itself. Therefore  $\text{cl}(\{x\}^c) \subseteq X$  and so  $\{x\}^c$  is  $\tilde{E}$ -closed in  $(X, \tau)$ .

**Theorem 4.12.** Let  $A$  be a  $\tilde{E}$ -closed set of a topological space  $(X, \tau)$ . Then,

- (i) If  $A$  is regular open, then  $\text{pint}(A)$  and  $\text{scl}(A)$  are also  $\tilde{E}$ -closed.
- (ii) If  $A$  is regular closed, then  $\text{pcl}(A)$  is also  $\tilde{E}$ -closed.

*Proof:*

(i) Since  $A$  is regular open in  $X$ ,  $A = \text{int}(\text{cl}(A))$ . Then  $\text{scl}(A) = A \cup \text{int}(\text{cl}(A)) = A$ . Thus,  $\text{scl}(A)$  is  $\tilde{E}$ -closed in  $(X, \tau)$ . Since  $\text{pint}(A) = A \cap \text{int}(\text{cl}(A)) = A$ ,  $\text{pint}(A)$  is  $\tilde{E}$ -closed.

(ii) Since  $A$  is regular closed in  $X$ ,  $A = \text{cl}(\text{int}(A))$ . Then  $\text{pcl}(A) = A \cup \text{cl}(\text{int}(A)) = A$ . Thus,  $\text{pcl}(A)$  is  $\tilde{E}$ -closed in  $(X, \tau)$ . The converses of the statements in the Theorem 4.12 are not true as we can see in the following examples.

**Example 4.13.** Let  $X = \{a, b, c\}$  with  $\tau = \{\phi, \{a\}, \{a, b\}, X\}$ . Then

$$\tilde{E}C(X) = \{\phi, \{c\}, \{b, c\}, X\}.$$

Then the set  $A = \{c\}$  is not regular open. However  $A$  is  $\tilde{E}$ -closed;  $\text{scl}(A) = \{c\}$  and  $\text{pint}(A) = \phi$  are also  $\tilde{E}$ -closed.

**Example 4.14.** In Example 4.13, the set  $A = \{c\}$  is not regular closed. However  $A$  and  $\text{pcl}(A) = \{c\}$  are  $\tilde{E}$ -closed.

**Lemma 4.15.** Let  $F$  be a closed set of  $(X, \tau)$ . Then the following properties hold:

if  $A$  is  $B$ -closed in  $(X, \tau)$ , then  $A \cap F$  is  $B$ -closed in  $(X, \tau)$ .

**Corollary 4.16.** If  $A$  is  $\tilde{E}$ -closed set and  $F$  is a closed set, then  $A \cap F$  is  $\tilde{E}$ -closed set.

*Proof:* Let  $U$  be a  $B$ -open set of  $(X, \tau)$  such that  $A \cap F \subseteq U$ . By Lemma 4.15, it shows that  $A \subseteq U \cup (X/F)$  and  $U \cup (X/F)$  is  $B$ -open in  $(X, \tau)$ . Since  $A$  is  $\tilde{E}$ -closed in  $(X, \tau)$ , we have  $\text{cl}(A)$

$\subseteq U \cup (X \setminus F)$  and so  $\text{cl}(A \cap F) \subseteq \text{cl}(A) \cap \text{cl}(F) = \text{cl}(A) \cap F \subseteq (U \cup (X \setminus F)) \cap F = U \cap F \subseteq U$ . Therefore  $A \cap F$  is  $\tilde{E}$ -closed in  $(X, \tau)$ .

## 5. CONCLUSION

In this article, we present two brand-new kinds of sets called  $\tilde{E}$ -closed sets and  $\tilde{E}_\alpha$ -closed sets in topological spaces, and we investigated some of their fundamental characterizations are arrived. This class is intermediate between the classes of closed sets and  $g$ -closed sets. And we can learn in various areas of topological spaces with associated applications.
